                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             cc toxin (Ctx) from Vibrio cholerae which do not bind to the ubiquitous CC GM-1 ganglioside receptors on host cell surfaces. Both Etx and Ctx are CC composed of one A subunit and five identical B subunits. The A subunit CC is responsible for toxicity, possessing adenosine diphosphate (ADP) ADP-CC ribosyltransferase activity, while the B subunits (EtxB and CtxB) CC facilitate the entry of subunit A into the host cell via the binding and Ccross-linking of GM-1 receptors. Although GM-1 binding is responsible CC for some of the effects of Etx and Ctx, it has been found that certain CC effects of the toxins, such as immunomodulation, are not mediated CC through GM-1 binding. The peptides of the invention are fragments of the beta-4- alpha-2 loop of EtxB and/or CtxB, exerting the same effects as CC cormal EtxB and ctxB subunits, except that they do not bind or cross link CC GM-1. They may be used in medicine as an immunomodulator or adjuvant. CC They may also be used as an inhibitor for toxin-induced diarrhoea.

CC for treating, preventing and/or modulating a disease associated with an accomposition of a composition of a treating and second diarrhoea.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAY87461
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CC The invention relates to peptide fragments of the Escherichia coli heat CC labile enterotoxin (Etx) and its closely related homologue, cholera CC toxin (Ctx) from Vibrio cholerae which do not bind to the ubiquitous CC GM-1 ganglioside receptors on host cell surfaces. Both Etx and Ctx are Ccomposed of one A subunit and five identical B subunits. The A subunit CC is responsible for toxicity, possessing adenosine diphosphate (ADP) ADP-CC ribosyltransferase activity, while the B subunits (EtxB and CtxB) CC facilitate the entry of subunit A into the host cell via the binding and Cross-linking of GM-1 receptors. Although GM-1 binding is responsible CC for some of the toxins, such as immunomodulation, are not mediated CC through GM-1 binding. The peptides of the invention (AAV87461-Y87463) are fragments of the beta-4-alpha-2 loop of EtxB and/or CtxB, exerting the CC same effects as normal EtxB and CtxB subunits, except that they do not CC bind or cross link GM-1. They may be used in medicine as an inhibitor for CC immunomodulator or adjuvant. They may also be used as an inhibitor for CC toxin-induced diarrhoea. Therefore, the peptides may be used in the CC disease associated with an immune disorder and/or toxin-induced corresponding to a portion of the beta-4-alpha-2 loop of EtxB and CtxB and CtxB has immunomodulatory effects. Peptide AAV87464 corresponds to residues CC sandomly selected control peptide. According to a portion of the beta-4-alpha-2 loop, and peptide AAV87465 is a ccardinal selected control peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches

Both Etx and Ctx are composed of one A subunit and five identical B subunits. The A subunit is responsible for toxicity, possessing adenosine diphosphate (ADP) ADP-CC ribosyltransferase activity, while the B subunits (EtxB and CtxB) CC facilitate the entry of subunit A into the host cell via the binding and CC cross-linking of GM-1 receptors. Although GM-1 binding is responsible CC for some of the toxins, such as immunomodulation, are not mediated through GM-1 binding. The peptides of the invention are fragments of the CC through GM-1 binding. The peptides of the invention are fragments of the beta-4 - alpha-2 loop of EtxB and/or CtxB, exerting the same effects as commal EtxB and CtxB subunits, except that they do not bind or cross link GM-1. They may be used in medicine as an immunomodulator or adjuvant. CC They may also be used as an inhibitor for toxin-induced diarrhoea. CC for treating, preventing and/or modulating a disease associated with an composition control of the composition control of composition of a composition control of control of control of control 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches
       This sequence corresponds to the CTP3 epitope of the Cholera toxin subunit. The DNA sequence encoding this ligates to othersynthetic oligonucleotides to form a new recombinant gene. This encodes a flagellin fusion protein which can be used in vaccines for immunous control of the control of 
                                                                                                                                                                                                                                                                                                                  New recombinant flagellin gene including sequence - for heterologous epitope, and expressed fusion proteins, useful in vaccines and for p
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Marjarian

                                                                                                                        A compsn. comprising a conjugate of an antigenic cholera B toxin peptide fragment (e.g. AAR85126-30 and egs. AAR85125), covalently bound to a microparticulate inert carrier (e.g. modified silica c thyroglobulin) can be used as an oral vaccine for immunisation against cholera infection. The inert carrier is insoluble in the digestive tract, allowing presentation of the antigen in the intestines, where it will elicit antibodies mainly of the
                                                                                                                                                                                                                                                     Vaccines for oral immunisation against infecting agents, e.g. cholera - comprise a conjugate of an antigen of an infecting agent covalently bound to micro:particulate inert carrier, e.g. modified

                                                                                                                                                                                                                                                                                                                                               GM-1 ganglioside receptors on host cell surfaces. Both Etx and Ctx are composed of one A subunit and five identical B subunits. The A subunit is responsible for toxicity, possessing adenosine diphosphate (ADP) ADP-ribosyltransferase activity, while the B subunits (ETXB and CTXB) facilitate the entry of subunit A into the host cell via the binding and cross-linking of GM-1 receptors. Although GM-1 binding is responsible for some of the effects of Etx and CTX, it has been found that certain effects of the toxins, such as immunomodulation, are not mediated through GM-1 binding. The peptides of the invention are fragments of the beta-4- alpha-2 loop of ETXB and/or CTXB, exerting the same effects as normal EtxB and CTXB subunits, except that they do not bind or cross link GM-1. They may be used in medicine as an immunomodulator or adjuvant. They may also be used as an inhibitor for toxin-induced diarrhoea.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to peptide fragments of the Escherichia coli he labile enterotoxin (Etx) and its closely related homologue, cholera toxin (Ctx) from Vibrio cholerae which do not bind to the ubiquitous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           glycolipid receptor GM-1 -

                                                                                                                                                                                                                                                                      Therefore, the peptides may be used in the production of a composition for treating, preventing and/or modulating a disease associated with an immune disorder and/or toxin-induced diarrhoea. Sequences AAY87460-Y87463 represent preferred peptides of the invention, AAY87460 being particularly preferred.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Disclosure; Page 15; 62pp; English.

                                                                                                                                                                                                                              GM-1 ganglioside receptors on host cell surfaces. Both Etx and Ctx are composed of one A subunit and five identical B subunits. The A subunit is responsible for toxicity, while the B subunits (EtxB and CtxB) facilitate the entry of subunit A into the host cell via the binding and cross-linking of GM-1 receptors. Although GM-1 binding is responsible for some of the effects of Etx and Ctx, it has been found that certain effects of the toxins, such as immunomodulation, are not mediated through GM-1 binding. The peptides of the invention are fragments of the beta-4 alpha-2 loop of EtxB and/Or CtxB, exerting the same effects as normal EtxB and CtxB subunits, except that they do not bind or cross link GM-1. They may be used in medicine as an immunomodulator or adjuvant.
                                                                                                                                                  Therefore, the peptides may be used in the production of a composition for treating, preventing and/or modulating a disease associated with an immune disorder and/or toxin-induced diarrhoea. Sequences AAY87460-Y874 represent preferred peptides of the invention, AAY87460 being particularly preferred.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to peptide fragments of the Escherichia coli heat labile enterotoxin (Etx) and its closely related homologue, cholera toxin (Ctx) from Vibrio cholerae which do not bind to the ubiquitous

                                                                                                                                                                                                                       of the hepatitis B virus surface antigen pre-52 region into a different position of the FimH adhesin of type I fimbriae. Restiction site handles (BgIII-sites) were introduced into the fimH gene, and the foreign epitopes are then inserted in-frame. In the selected positions the insertion of the epitopes did not significantly alter the adhesive function of the FimH protein. The expression of the chimeric proteins on the surface of fimbriae on bacterial hosts illustrated the possibility of using bacterial adhesins as general presenters of foreign antigens and epitopes. These chimeric genes may be used in the production of variant FimH adhesins which may be useful for targetting active compounds and microbial cells to locations comprising selected receptors to which
                                                                                                                                                                                                                                                                                                                                                                 which was used in the production of fimH fusion genes comprising the cholera toxin B subunit inserted into the fimH gene. This insert shows the inclusion of the B subunit into the FimH protein at position 224-226. The chimeric genes were then opt, further modified by insert.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            FimA;

Tests have shown that Arg in posns. 35, 67 and 73 play an important role in fixing these toxins to cell walls. The peptides are used in the treatment of, and vaccination against, cholera infections and animal and human infections due to E. coll (enterctoxin LT). The medicament may be administered by oral, intraperitoneal, sub-cutaneous or intravenous routes. For vaccines, pref. peptides having 15-30 AAs are injected without carriers. Unit dose when used as a medicament is 50-500mg as

                                                                                                             The inventors claim cholera toxin B1 subunit sequences which carry Arg in posn. 35, 67 or 73 (AAP30264, AAP30265, AAP30600). Tests have shown that Arg in posns. 35, 67 and 73 play an important role in fixing these toxins to cell walls. The peptides are used in the treatment of, and vaccination against, cholera infections and animal and human infections due to E. coli (enterctoxin LT). The medicament may be administered by oral, intraperitoneal, sub-cutaneous or intravenous routes. For vaccines, pref. peptides having 15-30 AAs are injected without carriers. Unit dose when used as a medicament is 50-500mg as
                                                                                                                                                                                                                                         Cholera toxin B, sub-unit polypeptide(s) as vaccines medicaments - effective against Escherichia coli and cholerae infections, are prepd. by solid phase peptide cholerae infections.
                                                                                  Sequence

Bordetella pertussis vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAR72540-R72545 are structurally equivalent B-subunits from three ADP-ribosylating toxins, pertussis holotoxin (PT), E. coli heat labile toxin (LT), and verotoxin-1 (VT). The structural information obtd. from these comparisons was used to identify sites which contribute to PT's biological activity. By modifying these sites the claimed PT mutants of the invention were produced, they can be used in the development of vaccines against Bordetella

                                                                                                                                                                                                                                                                                                                                                                                                                                                structure and function; (2) effecting mutagenesis (by removing or replacing a nucleotide sequence encoding at least one (aa)) of a tox operon; and (3) expressing mutant tox box in a Bordetella organism to produce the modified holotoxin. This method is used for modifying pertussis holotoxin, by studying its 3-dimensional crystalline structure. Modifying the holotoxin, alters its biological properties. By analysing the 3-dimensional crystalline structure of the pertussis holotoxin, functional (aa) which affect biological properties of the pertussis holotoxin can be identified. This can be used to predict (aa) which contribute to the toxicity of the holotoxin to produce immunoprotective, genetically-detoxified analogues of pertussis holotoxin. The present sequence represents an ADP-ribosylating toxin be subunit peptide used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      22-AUG-1994;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A method has been developed of producing a modified pertussis holotoxin, involving analysis of the 3-dimensional form of the crystalline holotoxin. The pertussis holotoxin modification process comprises:
(1) identification of at least one amino acid (aa) residue of the holotoxin for modification by analysing the 3-dimensional form of the crystalline holotoxin, in relation to known information of the protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Read RJ,

                                                                                            Ş
                                                                                                                                                                                                                      The invention relates to methods of preparing a pertussis holotoxin (PT) CC having a modified biological activity. One method comprises identifying at least 1 site in a PT that interacts with a molecule that is capable of CC forming a complex with the holotoxin and which molecule is an effector CC toxicity, cell binding or enzymatic activity of PT. The functional interacting site(s) are identified by analysing the three dimensional CC identified interacting site(s) are modified by x-ray crystallogaphy. The CC identified interacting site(s) are modified to alter toxicity, cell binding or enzyme activity of the PT. The methods can be used to alter a biological activity such as toxicity, enzymatic activity, mitogenicity, cell binding and adjuvanticity of the PT. The three-dimensional structure CC of PT have functional and/or structural resemblance to other bacterial CC toxins such as diphtheria toxin (PT), Pseudomonas exotoxin A (ETA), the CC heat-labile toxin of E. coli (LT) and verotoxin-1 (VT). The present
